

Data-selected chr16 ALPS–WMH regional evaluation

The region was selected after the primary WMH screen; regional analyses are internal and susceptible to winner selection.

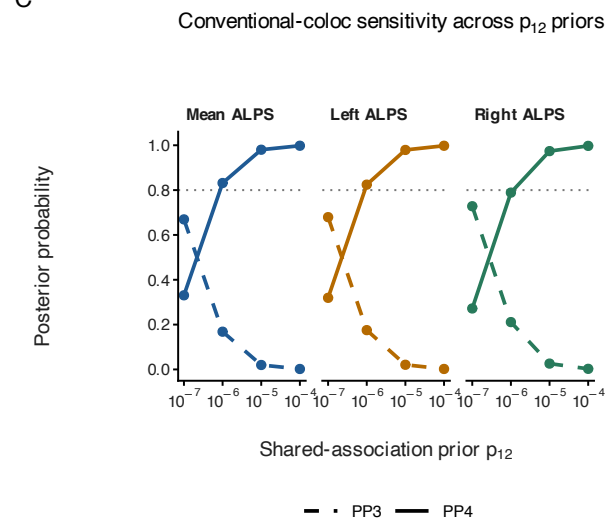

A

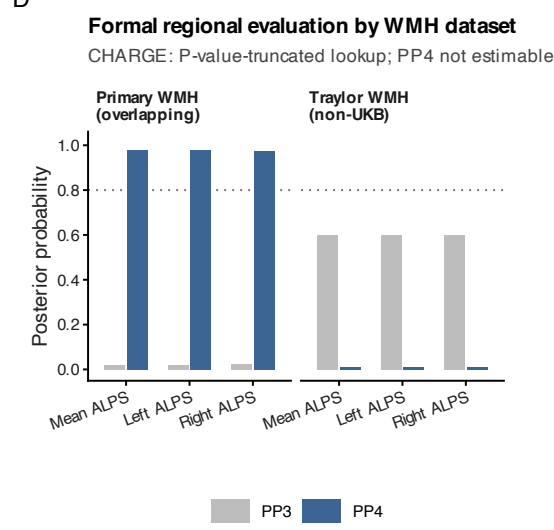

B

C

D

Primary ALPS and WMH GWAS substantially overlap. SuSiE addresses multiple association signals but not cross-trait sampling covariance from overlap. rs4843550 was retained in regional plots but excluded from the LD-based SuSiE set because its palindromic allele orientation was unresolved.
